CS-546 Lab 5

JSON Routes

For this lab, you will create a simple server that will provide data from an API.

For this lab, you will not need to use a database.

For this lab, you **must** use the `async/await` keywords (not Promises). You will also be using `axios` (<https://github.com/axios/axios>), which is a HTTP client for Node.js; you can install it with `npm i axios`. You will use it just as you did in lab 3.

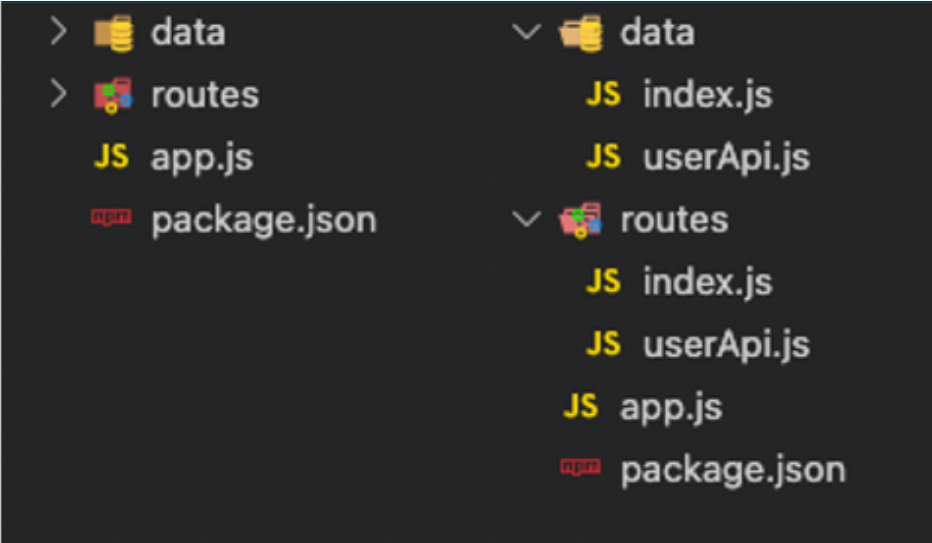

Network JSON Data

You will be downloading JSON files from the following GitHub Gists:

- [people.json](https://gist.github.com/graaffixnyc/31e9ef8b7d7caa742f56dc5f5649a57f/raw/43356c676c2cdc81f81ca77b2b7f7c5105b53d7f/people.json) [_\(https://gist.github.com/graaffixnyc/31e9ef8b7d7caa742f56dc5f5649a57f/raw/43356c676c2cdc81f81ca77b2b7f7c5105b53d7f/people.json\)](https://gist.github.com/graaffixnyc/31e9ef8b7d7caa742f56dc5f5649a57f/raw/43356c676c2cdc81f81ca77b2b7f7c5105b53d7f/people.json)
- [work.json](https://gist.github.com/graaffixnyc/febcd2ca91ddc685c163158ee126b4f/raw/c9494f59261f655a24019d3b94dab4db9346da6e/work.json) [_\(Links to an external site.\)](https://gist.github.com/graaffixnyc/febcd2ca91ddc685c163158ee126b4f/raw/c9494f59261f655a24019d3b94dab4db9346da6e/work.json) [_\(https://gist.github.com/graaffixnyc/febcd2ca91ddc685c163158ee126b4f/raw/c9494f59261f655a24019d3b94dab4db9346da6e/work.json\)](https://gist.github.com/graaffixnyc/febcd2ca91ddc685c163158ee126b4f/raw/c9494f59261f655a24019d3b94dab4db9346da6e/work.json)

Folder Structure

You will use the following folder structure for this lab:

In Lecture Code for Lab 5, we worked with MongoDB. For this lab, you will get data from Axios calls and should modify the data folder accordingly.

Your routes

`/people`

When making a GET request to `http://localhost:3000/people`, this route will return the JSON data that is returned from the axios call to the URL endpoint. You will use `people.json` for the list of people. You **MUST** return the data in JSON format.

/work

When making a GET request to `http://localhost:3000/work`, this route will return the JSON data that is returned from the axios call to the URL endpoint. You will use `work.json` for the list of companies. You MUST return the data in JSON format.

/people/:id

When making a GET request to `http://localhost:3000/people/:id`, this route will return the JSON data. You will use `people.json` Where `:id` is the parameter that is passed to the route: `http://localhost:3000/people/479` This endpoint returns a JSON object that has all the details for the person with that with the supplied `:id` **If the ID cannot be found in the Data(i.e. there is no person with that ID), or if the URL parameter is any other data type besides a positive whole number (all URL params are strings, so you will need to try to convert the URL param to a number), you will throw an error. You MUST return the data in JSON format.**

/work/:id

When making a GET request to `http://localhost:3000/work/:id`, this route will return the JSON data that is returned from the axios call to the URL endpoint. You will use `work.json` Where `:id` is the parameter that is passed to the route: `http://localhost:3000/work/729` This endpoint returns a JSON object that has all the details for the company with that with the supplied `:id` **If the ID cannot be found in the Data(i.e. there is no company with that ID), or if the URL parameter is any other data type besides a positive whole number (all URL params are strings, so you will need to try to convert the URL param to a number), you will throw an error. You MUST return the data in JSON format.**

Packages you will use:

You will use the **express** package as your server.

You will use the **axios** package to get data from the API.

You can read up on **express** (<http://expressjs.com/>) on its home page. Specifically, you may find the **API Guide section on requests** (<http://expressjs.com/en/4x/api.html#req>) useful.

You may use the **lecture 5 code** (https://github.com/stevens-cs546-cs554/CS-546/tree/master/lecture_05/code) as a guide.

You must save all dependencies to your package.json file

Requirements

1. You **must not submit** your `node_modules` folder
2. You **must remember** to save your dependencies to your `package.json` folder
3. You **must remember** to update your `package.json` file to set `app.js` as your starting script!
4. You **must** submit a zip archive or you will lose points, named in the following format: `LastName_FirstName_CS546_SECTION.zip`. You will lose points for not submitting an archive named this way.
